Figure 4. Epoch 4 for EfficientNet

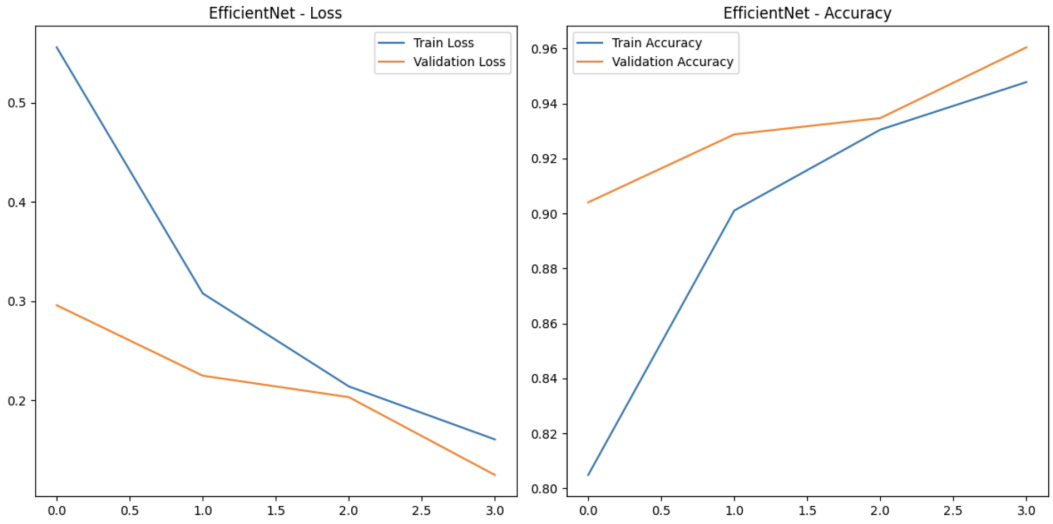

Figure 5. Loss and Accuracy Graphs for EfficientNet

Over the 4 epochs, the EfficientNet model demonstrated steady improvement, with training accuracy rising from 80.48% to 94.78% and validation accuracy reaching 96.04%. Both training and validation loss consistently decreased, the validation loss being lower than the training loss meaning 4 epochs was a good stopping point and there might be slight overfitting. The model performed strongly on classes like cardboard, metal, paper, and plastic, achieving high precision, recall, and F1-scores. However, the trash class struggled with lower metrics, particularly recall (56% in Epoch 3, improving to 84% in Epoch 4), maybe due to class imbalance or overlapping features with other categories. Addressing the underperformance of "trash" by increasing its representation or refining features could further improve results. By Epoch 4, the model appears to have converged, with diminishing returns expected from additional epochs. Overall, the model achieves high accuracy and robust performance, with room for targeted improvements.

Figure 9. Epoch 4 for ResNet50

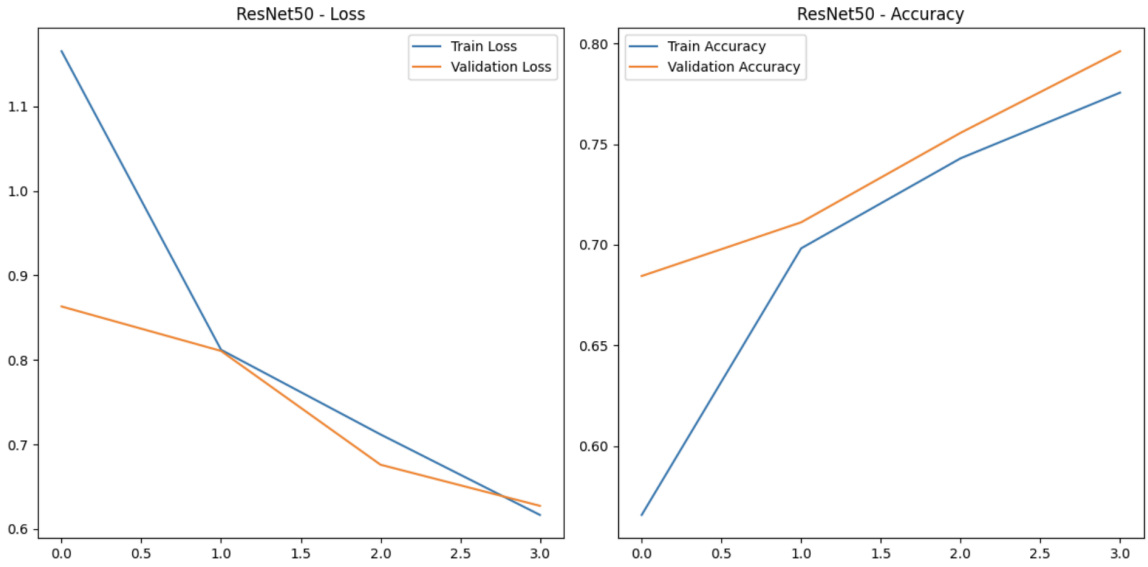

Figure 10. Loss and Accuracy Graphs for ResNet10

Over the 4 epochs, the ResNet50 model showed steady improvement in both training and validation metrics. Training accuracy rose from 56.57% in Epoch 1 to 77.57% in Epoch 4, while validation accuracy improved from 68.45% to 79.62%. Similarly, training and validation loss consistently decreased, indicating effective model convergence. However, since the training loss was slightly lower than the validation loss, there is still room to run more epochs. The model performed strongly on categories such as cardboard and paper, achieving high precision, recall, and F1-scores by the final epoch. However, categories like trash struggled, with poor recall (as low as 2% in Epoch 1 and remaining at 2% in Epoch 4). While the alignment between training and validation metrics indicates good generalization, there seems to be great variability across classes. Overall, ResNet50 demonstrates strong potential for waste classification, but further improvements targeting underperforming classes are necessary to achieve balanced performance across all categories.
